

AJAX-Asynchronous javascript and XML

To replace the portion of the page dynamically, without reloading the entire page

Example

based on country selection populate state dropdown

after successful login display welcome username on the top of the page

1. Ajax request will send to ajax engine, it will convert it into http request
2. httprequest will be handled by the server and it sends the data to ajax engine
3. ajax engine will send it to javascript code
4. javascript code will display it in the browser
